What to expect at home

Pain management
Follow the instructions given to you by your healthcare team for taking medicine. Some people go home taking over-the-counter medicine to manage pain, and some people go home with prescription medicine to manage pain. Your healthcare team will talk with you about what is best for you. There are other things you can do to manage pain like moving around, using an ice pack, deep breathing, and finding a distraction like music, TV, and games. What works best is different for each person.

Incision care
- Wash the area gently with warm, soapy water every day in the shower.
- Pat the area dry with a clean towel.
- If your incision is draining, cover it with a dry gauze pad and medical tape or with an adhesive bandage (e.g., Band-Aid®).
- Once the incision is not draining, leave it uncovered.
- If you have staples at the incision, they will be removed at your follow-up visit seven to 14 days after surgery.
- If you have clear surgical glue on your incision, it will fall off in 10 to 14 days.
- Do NOT:
  - Use hydrogen peroxide or alcohol on the incision.
  - Soak in a bath or get in a pool until at least two weeks after surgery.
  - Put ointments, creams or oils on the incision for six weeks.

Daily weights
- Record your weight the day that you get home from the hospital and every morning thereafter.
- Record morning weights on a record sheet or the same document.

Who and when to call for problems
Call your surgeon’s office for:
- Pain that is not getting better or gets worse
- Fever over 103.4°F
- Incision opens up or is bleeding
- Incision becomes redder, hard or has pus in it
- Signs of dehydration that do not get better by drinking water
- Urine (pee) is cloudy or smells very bad
- Blood in stools more than three days after surgery
- Nausea or vomiting that does not stop
- Not getting better as expected
- Heart seems to be beating fast and irregular
- Extreme shortness of breath that does not go away in 30 to 45 minutes of rest
- Persistent cough
- Unresolved constipation
- Weight gain of 3 pounds overnight or an accumulation of 5 pounds in a week
- Increased swelling, redness or pain in the legs
- Continued numbness of arms/legs, any absence of speech function, blurred vision, increased sleepiness/lethargy or change in personality
- Call 911 for:
  - Passing out
  - Sudden chest pain
  - Shortness of breath that is getting worse

What are a few common heart surgeries?
Coronary artery bypass surgery: During bypass surgery, heart blockages are not removed. Rather, a new pathway is created around the blocked part of the artery. Blood flows through the graft and bypasses the blocked part of the artery.

Valve surgery: During valve surgery, an incision is made into the heart to expose the poorly functioning valve. The valve is exposed, and depending on the condition of the valve, it will be repaired or replaced.

What does the heart do?
The heart pumps blood around your body with each heartbeat. It is the muscle at the center of your circulatory system that sends oxygenated blood to all parts of the body and removes waste from the cells. Over time, your heart can become impaired related to valves no longer working properly or blockages that develop, reducing good blood flow to the heart. This can result in the need for heart surgery.

Morning of surgery
Bathe with chlorhexidine (CHG or Hibiclens®). Wash your entire body except your face and genital area with chlorhexidine for three minutes.

Recall: What to expect as you start your recovery
Surgery day
- Manage pain with medicine taken by mouth
- Drink liquids
- Eat if able
- Use incentive spirometer every hour while awake
- Cough and deep breathe
- Spend time out of bed
- Start walking

Did you know?
- Drinking clear liquids up to two hours before surgery helps prevent infection after surgery.
- Sitting up for all meals
- Use your incentive spirometer about 10 times every hour while awake in the hospital and at home for four days before discharge
- Eat food
- Drink six to eight glasses of liquids
- Manage pain with medicines taken by mouth
- Sit up for meals

Resume: What to expect when going home
Pain management
- It is normal to have some pain while you are healing
- Follow medicine instructions given to you by your healthcare team
- Use deep breathing, walking and distractions like music to help with pain management

Drinking
- Drink at least six to eight glasses of water every day to stay hydrated
- Watch for signs of dehydration, including being overly tired, having a dry mouth, feeling dizzy, having nausea, having dark-colored urine (pee) or urinating less than normal
- Drink water if you have any of these signs. If you are not getting better after drinking water, call your healthcare team

Eating
- Eat healthy foods like cooked vegetables, low-fat dairy products, and proteins like lean meats and chicken

Activity
- Use your incentive spirometer about 10 times every hour while awake in the hospital and at home for four days before discharge
- Increase what you do each day to get back to your regular activities
- Do NOT drive until you are cleared by your surgeon
- Ask your healthcare team when you can start activities like jogging, cycling and lifting weights

Driving
- Do NOT drive until you are cleared by your surgeon

Returning to work
- Going back to work depends on the type of work you do. Talk to your healthcare team to decide what is best for you.
- Slowly increase the hours you work

Prepare: Getting ready for your surgery
Today
- Drink six to eight glasses of fluids, especially water, every day before surgery.
- Limit alcohol: Beer, wine and liquor. Stop drinking alcohol 24 hours (one day) before surgery
- Stop smoking

Day before surgery
Bathe with chlorhexidine (CHG or Hibiclens®). Wash your entire body except your face and genital area with chlorhexidine for three minutes.

Day of surgery
- Bath with chlorhexidine (CHG or Hibiclens®). Wash your entire body except your face and genital area with chlorhexidine for three minutes.
- Drink clear liquids up to two hours before surgery. You may have a special pre-surgery drink ordered. If you are asked to drink it, it should be the last thing that you have.
- Finish it 4 hours before surgery
- Arrive at the hospital at
- Do NOT:
  - Shave
  - Use lotions
  - Put on makeup or perfumes

About the heart
• The heart pumps blood around your body with each heartbeat.
• It is the muscle at the center of your circulatory system that sends oxygenated blood to all parts of the body and removes waste from the cells.

- Did you know? Following instructions for bathing before surgery helps prevent infection after surgery.
- Did you know? Drinking fluids, especially water and eating healthy foods before surgery will help your body heal after surgery.

About the heart
About the heart

Day after surgery and beyond
- Manage pain with medicine taken by mouth
- Drink six to eight glasses of liquids
- Eat solid food
- Sit up for meals
- Use incentive spirometer every hour while awake
- Cough and deep breathe
- Spend time out of bed to promote healing
- Walk in the halls at least four times each day

Before going home, you will need to:
- Walk safely in the halls
- Eat and drink without nausea or vomiting
- Manage pain with medicine taken by mouth
- Understand new prescriptions
- Show signs your bowels are working
- Understand new prescriptions
