

Lung Cancer Screening

People who are at high risk for lung cancer can take advantage of our new lung cancer screening.

According to the American Cancer Society, lung cancer is the leading cause of cancer death. A study conducted by the National Cancer Institute proved that screening people at high risk of lung cancer with low-dose CT scans reduce mortality from lung cancer by 20 percent. This study estimates early detection and treatment of lung cancer could save more than 70,000 lives per year.

Our lung cancer screening offers those at high-risk of lung cancer the opportunity to screen and diagnose lung cancer before symptoms develop through use of a simple low-dose Computed Tomography (CT) scan of the lungs.

Candidates for Screening

- High risk population of current and former smokers over the age of 55
- People that have smoked the equivalent of one pack per day for 30 years or three packs a day for 10 years

A physician referral is required. To refer a patient for our lung cancer screening, call **817.912.8400**. For more information, visit TheCardiovascularConsultants.com.
